## ## Computational Methods - Unit 3: Solving Linear Systems and Eigenvalue Problems

**\*\*Introduction:\*\*** Unit 3 focuses on advanced techniques for solving systems of linear equations and finding eigenvalues/eigenvectors, crucial for many scientific and engineering applications. We explore LU decomposition methods and an iterative approach for eigenvalue problems.

### **\*\*Key Concepts:\*\***

\* **\*\*LU Decomposition:\*\*** Decomposing a matrix  $A$  into a lower triangular matrix ( $L$ ) and an upper triangular matrix ( $U$ ), simplifying solving  $Ax = b$ .

\* **\*\*Dolittle Algorithm:\*\*** A variant of LU decomposition where the diagonal elements of  $L$  are all 1.

\* **\*\*Crouts Algorithm:\*\*** A variant of LU decomposition where the diagonal elements of  $U$  are all 1.

\* **\*\*Cholesky Method:\*\*** Specialized LU decomposition for symmetric, positive definite matrices where  $U$  is the transpose of  $L$ .

\* **\*\*Eigenvalue Problem:\*\*** Finding scalars (eigenvalues) and corresponding non-zero vectors (eigenvectors) that satisfy  $Ax = \lambda x$ .

\* **\*\*Power Method:\*\*** An iterative method to find the dominant eigenvalue (largest magnitude) and its corresponding eigenvector.

### **\*\*Examples:\*\***

\* **\*\*Dolittle:\*\*** Solve the system of equations:  $2x + y = 5$ ,  $x + 2y = 6$ . Decompose the coefficient matrix into  $L$  and  $U$  using Dolittle's method and then solve for  $x$  and  $y$ .

\* **\*\*Cholesky:\*\*** Decompose a symmetric positive definite matrix like  $\begin{bmatrix} 4 & 2 \\ 2 & 5 \end{bmatrix}$  into  $L$  and  $L$  transpose.

\* **\*\*Power Method:\*\*** Apply the power method to a matrix to find its dominant eigenvalue and eigenvector. Start with an initial guess vector and iterate until convergence.

### **\*\*Real-world Applications:\*\***

## AI Generated Study Notes

- \* **Structural Analysis:** Solving for stresses and strains in structures using finite element analysis (Cholesky decomposition).
- \* **Fluid Dynamics:** Simulating fluid flow using numerical methods (LU decomposition).
- \* **Quantum Mechanics:** Finding energy levels of quantum systems (Eigenvalue problems).
- \* **Image Processing:** Principal component analysis (PCA) uses eigenvalues and eigenvectors for dimensionality reduction.
- \* **Stability Analysis:** Determining the stability of dynamic systems (Eigenvalue problems).

### **Summary:**

Unit 3 equips us with powerful computational tools for solving linear systems efficiently using LU decomposition (Dolittle, Crout, Cholesky) and finding dominant eigenvalues/eigenvectors using the power method. These methods have wide-ranging applications in various scientific and engineering disciplines.
